_____ As of Release 0.73 _____

MAJOR

MINOR

- 0.73 One loop executes after dynamically adding targets before the targets are allocated their subscription licenses, if available. An alert warns of the unlicensed targets for that loop, which is corrected in an -OK- alert on the next loop if sufficient subscription license count exists.
- 0.73 Uninstall may not remove shortcuts installed in the Windows Start Menu. If not these may be removed manually after uninstalling.
- 0.68 Checking of the program's host with the self.cfg file requires the machine to have a working network connection.
- 0.68 On Windows installing without a working network connection may cause the install process to hang at the end with the *Thank You* web page displayed. The installation has completed correctly; simply close the command window.
- Firefox revs. 57-60 have a minor bug that allows a brief flash of an unformatted (unstyled) web page while the UWI is loading certain web pages. Chrome, Safari, MS browsers and other versions of Firefox are not affected. No functional affect, transient cosmetic affect only.
- 0.64 Column alignment in reports shifts right for long discovered target names. (Discovery-only issue on advanced Appchkr's.)
- 0.63 Startup pages on both OS's do not complete until discovery does, if it's used. (Advanced types only). Discovery log is available during this time.
- 0.57 Inital UWI page occasionally slow to open after startup, sometimes requiring two tries. Always OK after that.
- 0.54 Flashing command prompt windows at startup on MSWindows. Non-functional.
- 0.52 Small memory growth occurs in very active long-running configurations.
- 0.40 On some Windows 7 systems starting a chkr instance from the UWI erroneously shows some of the startup batch script commands in the startup output. Appearance only issue -- no functional consequence.
